C

D

Supplemental Figure S2. Histological identification of vascular boundaries using selected anti-human mAb clones and the illustration of the superselective injection procedure. (A) Double immunofluorescence staining of a liver metastasis of pancreatic cancer with antibody clones WM59 and HA58. (B) Representative images of CD34 expression in different human liver tumors. HCC: hepatocellular carcinoma; LMTS, liver metastasis of pancreatic cancer; Crc MTS: Liver metastasis of colorectal cancer (C) Illustration of the principle of the endothelial capture technique in human applications. The superselective injection of antibodies could be achieved using intraportal (for liver segment imaging, left picture) or intraarterial (for tumor and liver segment imaging, right picture) access.
