## Supplementary Materials and Methods

Synthesis of the PSMA binding motif

Figure. S1. Synthesis of PSMA binding motif.
i) Wang resin ( $1 \mathrm{eq} ., 1.0 \mathrm{mmol} / \mathrm{g}, 1.00 \mathrm{~g}$ ) was swollen in 10 mL DMF for 10 minutes. Fmoc-Lys(Mtt)-OH ( 3 eq., $3 \mathrm{mmol}, 1.87 \mathrm{~g}$ ), 4-dimethylaminopyridine ( $1 \mathrm{eq} ., 1 \mathrm{mmol}, 122.2 \mathrm{mg}$ ), HOBt ( 3.6 eq., 3.6 mmol , 1 M in DMF) and DIPCDI ( $3.3 \mathrm{eq} ., 3.3 \mathrm{mmol}$, 1 M in DMF) were added to the resin and mixed on a bench roller for 20 hours. The reagents were removed from the resin by vacuum filtration. The resin was washed with DMF ( $3 \times 10 \mathrm{~mL}$ ) and DCM ( $3 \times 10$ $\mathrm{mL})$. The Fmoc-loading was determined to be $0.5 \mathrm{mmol} / \mathrm{g}$. Next, the resin was capped with a solution of pyridine ( $0.34 \mathrm{~mL} / \mathrm{g}$ resin) and benzoyl chloride ( $0.34 \mathrm{~mL} / \mathrm{g}$ resin) in DCM for 1 hour.
ii) The resin was washed with DCM ( $3 \times 10 \mathrm{~mL}$ ) and DMF ( $3 \times 10 \mathrm{~mL}$ ) and after Fmoc removal ( $20 \%$ piperidine in DMF, $3 \times 6 \mathrm{~min}$ ), DIPEA ( $0.52 \mathrm{~mL}, 3$ eq., 3 mmol ), 4-nitrophenyl chloroformate ( 2 eq ., $2.0 \mathrm{mmol}, 402 \mathrm{mg}$ ) in 2 mL DCM were added to the $\mathrm{H}-\mathrm{Lys}(\mathrm{Mtt})$-resin (1eq, $0.5 \mathrm{mmol} / \mathrm{g}, 2 \mathrm{~g}$ ) and the resin was agitated for 1 hour. Consecutively a Kaiser test was performed to check for completion (1).
iii) Glutamic acid di-tert-butyl ester hydrochloride ( 3 eq., $3 \mathrm{mmol}, 887.4 \mathrm{mg}$ ) and DIPEA (4 eq., $4 \mathrm{mmol}, 0.70 \mathrm{~mL}$ ) in DCM were added to the resin and the mixture was agitated for 1 hour. The resin was washed with DCM ( $3 \times 10 \mathrm{~mL}$ ) and DMF ( $3 \times 10 \mathrm{~mL}$ ).

## General synthesis of the ligands

Mtt deprotection: Resin was treated with $1.8 \% \mathrm{TFA}$ in $\mathrm{CHCl}_{3}$ for 4-5 times during 5 minutes until the filtrate was not yellow anymore. Per 100 mg of resin 3 mL of TFA/ $\mathrm{CHCl}_{3}$ solution was used. The deprotection was checked with UV-Vis and mass spectrometry.

DIPCDI coupling of protected amino acids: Fmoc-protected amino acid (3.0 eq.), 1hydroxybenzotriazole hydrate (HOBt, 1M in DMF, 3.6 eq.), $\mathrm{N}, \mathrm{N}$ '-Diisopropylcarbodiimide (DIPCDI, 1M in DMF, 3.3 eq.) were added to the resin and agitated until the Kaiser test was negative ( $\sim 45$ minutes) after which the resin was washed with DMF ( $3 \times 10 \mathrm{~mL}$ ).

Figure. S2. Synthesis of ligands (shown for DOTAGA as a chelator).

HATU coupling of protected amino acids: Fmoc-protected amino acid (3.0 eq.), 1hydroxybenztriazole hydrate (HOBt, 3.6 eq.), $\mathrm{N}, \mathrm{N}, \mathrm{N}^{\prime}, \mathrm{N}^{\prime}$-Tetramethyl-O-(1H-benzotriazol-1yl)uronium hexafluorophosphate (HBTU, 2.9 eq.) and N , N '-diisopropylethylamine (DIPEA, 6 eq.) were dissolved in DMF. The solution was pre-activated for 2 minutes before it was added to the resin. The mixture was agitated until the Kaiser test was negative ( $\sim 1.5 \mathrm{hrs}$.) after which the resin was washed with DMF ( $3 \times 10 \mathrm{~mL}$ ) and DCM ( $3 \times 10 \mathrm{~mL}$ ).

Fmoc deprotection: The resin was treated with $20 \%$ piperidine in DMF 3x6 minutes. The product was washed with DMF ( $3 \times 10 \mathrm{~mL}$ ).

DOTAGA or DOTA coupling: DIPEA (2 eq.) and DOTAGA anhydride or DOTA-OSu were added to the resin in NMP and mixed on a bench roller at room temperature or stirred at $70^{\circ} \mathrm{C}$ respectively for 6-8 hrs.

Resin cleavage: All peptides were cleaved from the resin with trifluoroacetic acid/ $\mathrm{H}_{2} \mathrm{O}(95: 5$, $\mathrm{v} / \mathrm{v}$ ) for two hours after which the resin was filtered off and the peptide was precipitated in diethyl ether. After drying in air the crude peptide was lyophilized from water.

Conjugation with IRDye700DX: Peptide was dissolved in phosphate buffer ( $0.25 \mathrm{M}, \mathrm{pH} 8)$ after which the dye OSu ester (1.0 eq. in dry DMF) was added and shaken at rt for 4-6 hrs. The product was purified directly by preparative HPLC.

Analytical HPLC: Compounds were analyzed on a Shimadzu LC-20A Prominence system with a dual UV-Vis detector (Shimadzu, 's Hertogenbosch, The Netherlands) equipped with a C18 Gemini-NX column, $150 \times 3 \mathrm{~mm}$, particle size $3 \mu \mathrm{~m}$ (Phenomenex, Utrecht, The Netherlands) Solvent A was $0.1 \%$ trifluoroacetic acid (TFA) in $\mathrm{H}_{2} \mathrm{O}$ and solvent B was $0.1 \%$ TFA in acetonitrile (MeCN). A gradient of 5-100\% acetonitrile ( 30 min .) was applied.

Preparative HPLC: All compounds were purified on a Shimadzu dual-pump LC-20A Prominence system (Shimadzu, 's Hertogenbosch, The Netherlands) equipped with a C18 Gemini-NX column, $150 \times 10 \mathrm{~mm}$, particle size $10 \mu \mathrm{~m}$ (Phenomenex, Utrecht, The

Netherlands), applying a gradient of 20-70\% methanol in triethylammonium acetate buffer (10 $\mathrm{mM}, \mathrm{pH} 7$ ) for all IRDye containing compounds or a gradient of 5-100\% acetonitrile in water ( $0.1 \% \mathrm{TFA}$ ) for all others.

## Competitive binding assays

Scatchard analysis was performed to determine the dissociation constant (Kd) of the N064 ligand. LS174T-PSMA-positive cells were cultured to confluence in 6-wells plates, washed with 2 ml PBS and incubated for 4 h on ice with increasing concentrations of ${ }^{111}$ In-labeled ligand ( $0.03-30 \mathrm{nM}$ ) in 1 ml binding buffer (RPMI 1640 containing $0.5 \% \mathrm{w} / \mathrm{v}$ BSA). Nonspecific binding was determined by coincubation with $1 \mu$ M PSMA-617. After incubation, cells were washed with 2 ml PBS twice and lysed with 1.5 ml 0.1 M NaOH , which causes detachment and lysis of the cells from the 6-wells plate. Cell lysis was collected from the plate and the cell-associated activity was measured in a $\gamma$-counter. The specific binding (total binding - nonspecific binding) was plotted against the bound/free ratio. To determine PSMA antigen density per cell and the Kd of multimodal ligands, data were analyzed by linear regression using GraphPad Prism software.

The 50\% inhibitory concentration (IC50) of PSMA-N064 was determined using PSMAexpressing LS174T-PSMA cells in a competitive binding assay. The LS174T-PSMA cells were cultured to confluency in 6-wells plates, followed by washing with 2 ml PBS and incubation on ice for 2 h in 1 mL of binding buffer (RPMI 1640 containing $0.5 \% \mathrm{w} / \mathrm{v}$ BSA) with $50,000 \mathrm{cpm}$ of 111 In -labeled ligand and a series of increasing concentrations (0.01-300 nM ) of unlabeled PSMA-N064. After incubation, cells were washed with 2 ml PBS twice and lysed with 1.5 ml 0.1 M NaOH , which causes detachment and lysis of the cells from the 6wells plate. Cell lysis was collected from the plate and the cell-associated activity was measured in a $\gamma$-counter and IC50 values were calculated using GraphPad Prism software.

## Supplementary Results

Figure. S3. Stability of ${ }^{111} \mathrm{In}$-PSMA-N064 during radiolabeling at $\mathbf{p H} 5.5,45{ }^{\circ} \mathbf{C}$. (A) Radionuclide HPLC chromatogram of ${ }^{111} \mathrm{In}$-PSMA-N064 labeled with ${ }^{111} \mathrm{InCl}_{3}$ for 10 min [1], 20 $\min$ [2], 30 min [3], and fluorescence HPLC chromatogram labeled with ${ }^{111} \mathrm{InCl}_{3}$ for 30 min [4] in 2-(N-morpholino)ethanesulfonic acid (MES) buffer, $5 \mathrm{MBq} / \mu \mathrm{g}, \mathrm{pH} 5.5,45^{\circ} \mathrm{C}$. (B) [1] Radioactivity HPLC chromatogram of ${ }^{111}$ In-PSMA-N064 labeled with ${ }^{111} \mathrm{InCl}_{3}$ for 30 min . Peaks 2 and 3 were collected for a subsequent binding assay. [2] PSMA-bound fraction of peak 1, peak 2 and ${ }^{111}$ In-PSMA-617 (reference compound) in LS174T-PSMA and LS174T wildtype cells in vitro.

Figure. S4. Uptake of ${ }^{111}$ In-labeled multimodal ligands in PSMA-positive cells in vitro and in vivo. (A) PSMA-receptor bound and internalized fraction of 12 multimodal ligands in PSMA-positive LS174T-PSMA cells in vitro. (B) PSMA-positive tumor uptake of ligands (n $=5 \mathrm{mice} /$ group, $0.3 \mathrm{nmol} /$ mouse, 2 hrs p.i., $10 \mathrm{MBq}{ }^{111} \mathrm{In} / \mathrm{mouse}$ ) in mice bearing LS174TPSMA xenografts.

Figure. S5. Absolute uptake of ${ }^{111}$ In-PSMA-N064 ligand. Absolute uptake of ${ }^{111}$ In-PSMA-N064 ( $\mathrm{n}=5 \mathrm{mice} /$ group, $0.1-3 \mathrm{nmol} / \mathrm{mouse}, 2 \mathrm{hrs}$ p.i., $1 \mathrm{MBq} / \mathrm{mouse}$ ) in mice bearing LS174T-PSMA and LS174T xenografts, including effect of PSMA-617 co-injection ( 10 nmol ).

Table S1. Dose and time optimization of ${ }^{111}$ In-PSMA-N064 in mice bearing LS174T-PSMA and LS174T xenografts.

* Gleason score of the tumor as determined by a pathologist using biopsies taken before surgery.
** Gleason score of the tumor as determined by a pathologist after surgical removal of the prostate.
*** No malignancy in biopsies taken after radical prostatectomy, patients excluded.
**** SNR: Signal-to-noise ratio

Figure. S7. Quantification of ${ }^{111}$ In-PSMA-N064 and ${ }^{111}$ In-PSMA-N140 incubated prostate cancer biopsies taken during radical prostatectomy. (A) Mean fluorescence intensity per patient (P1-8), based on Odyssey fluorescence images. (B) Mean fluorescence intensity of low grade (Gleason $\leq 3+4=7$ ) and low grade (Gleason $\geq 4+3=7$ ) biopsies, as determined by a pathologist using biopsies taken before surgery. Tumor regions within the tumor biopsy were compared to fluorescence intensity in normal regions within the tumor biopsy and normal regions in the control biopsy, as defined by a pathologist. $*<0.01, * * *<0.001$, $\mathrm{ns}=$ not significant.
