Figure S1. Illustration of demographic information of all patients involved in this study. Information on sex, age, smoking history, cancer subtype, cancer stage, and therapeutic response of all patients are shown by bars with distinct colors. Sampling conditions in WES (DNA) is also indicated. LADC = lung adenocarcinoma; LUSC = lung squamous cell carcinoma.

Figure S2. Flowchart showing the procedure of sampling, targeted NGS, and data analysis in this study. Lung cancer tissue samples were collected before and after chemotherapy and were examined by WES and transcriptome sequencing. Mutational change, TMB, antigen presentation, and their correlation with therapeutic response were analyzed.

Figure S3. The status of unique mutations and common mutations before and after chemotherapy. The ratio of unique and common mutations is shown for each patient for LADC and LUSC in the left panel, and the statistics for these is shown in the right panels. A significantly lower percentage was found in post-therapeutic unique mutations in LUSC while this was not observed with LADC.

Figure S4. Pathway enrichment analysis on mutations before and after chemotherapy. (A) GO and KEGG enrichment analysis on mutations before chemotherapy; (B) GO and KEGG enrichment analysis on mutations after chemotherapy

Figure S5. The correlation between the trend of TMB change and patients survival of never-smoking patients.

Figure S6. The distribution of CNVs across each chromosome of each patients. (A) the CNVs before chemotherapy; (B) the CNVs after chemotherapy.

Figure S7. The distribution of CNVs at arm and focal level. (A) the distribution of CNVs at the arm level (red represents the amplification, blue represents the deletion; chromosome having significant amplification was marked in red, having significant deletion was marked in blue and having both significant amplification and deletion was marked in green); (B) the distribution of pre-therapeutic CNVs at the focal level (red represents the amplification, blue represents the deletion); (C) the distribution of post-therapeutic CNVs at the focal level (red represents the amplification, blue represents the deletion).
