Contents:

Section A: Supplementary Figures 1-10

Section B. Supplementary Tables 1-7

Section A. Supplementary Figures

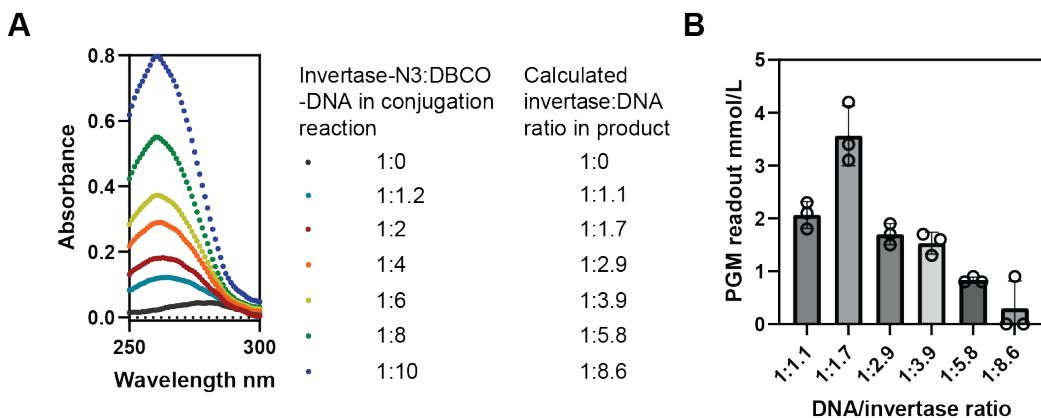

Figure S1. Synthesis of invertase-ssDNA conjugate and optimization of its composition for optimal performance. (A) UV-Vis absorption spectrum illustrating the composition of the invertase-ssDNA conjugate formed during the conjugation reaction, with varying ratios of DBCO-DNA to invertase-N3. (B) PGM readouts of the Cas12a/ILR/PGM system constructed with DNA/invertase conjugates at different ratios, stimulated by 10 pM ssDNA target. A ratio of 1:1.7 was selected for subsequent investigations.

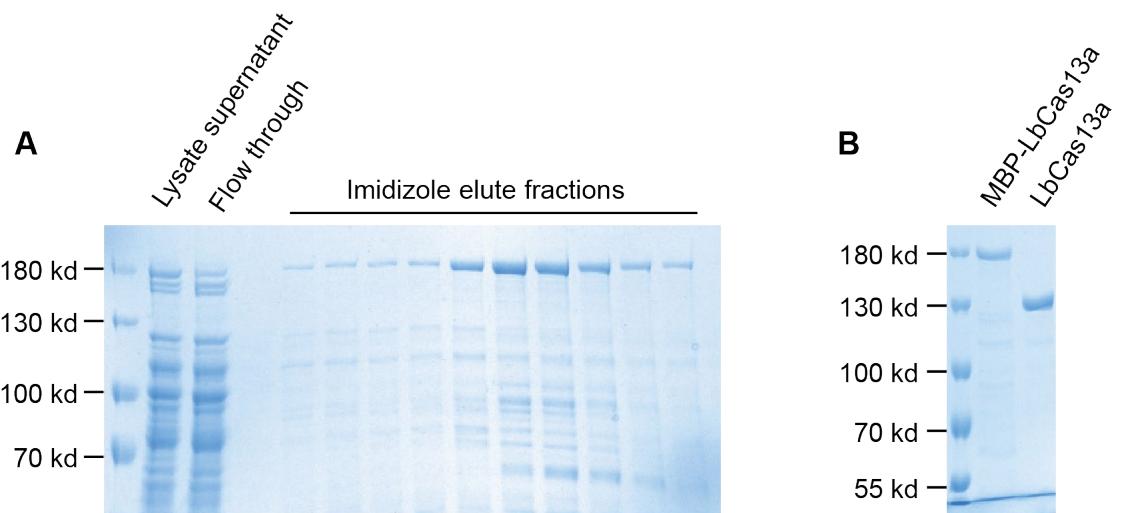

Figure S2. Representative Coomassie blue-stained gels for LbCas12a purification. (A) Filtered lysate supernatant was loaded onto Ni-NTA resins and subsequently washed and eluted with buffers containing 10 mM and 50 mM imidazole, respectively. (B) Elute fractions with high protein content were subjected to TEV cleavage and further purified using Ni-NTA resins, resulting in a highly pure LbCas12a preparation.

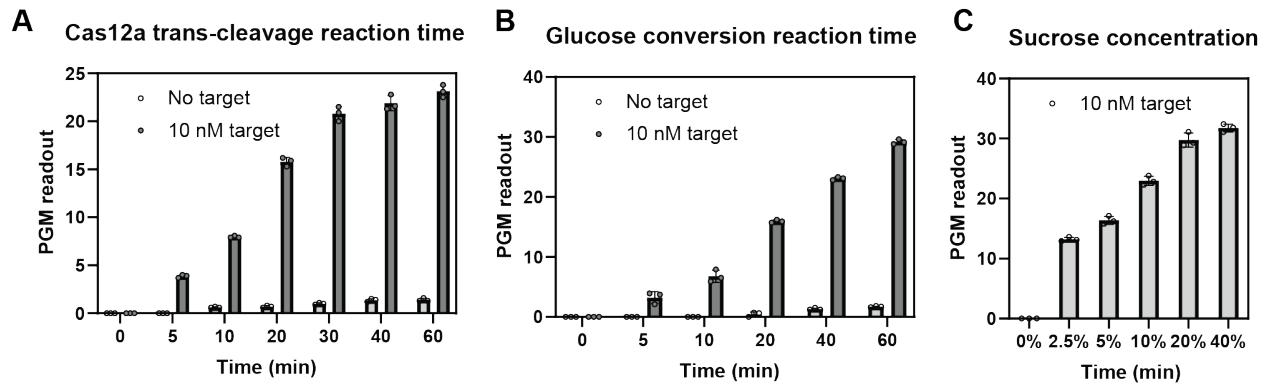

Figure S3. Optimization of detection parameters. (A) A reaction time of 30 min was selected for the Cas12a trans-cleavage reaction, as the signal approached a plateau at this time. (B) A reaction time of 20 min was chosen for the glucose conversion reaction, as it produced negligible noise while yielding a satisfactory PGM readout. (C) A sucrose concentration of 20% was selected for optimal performance.

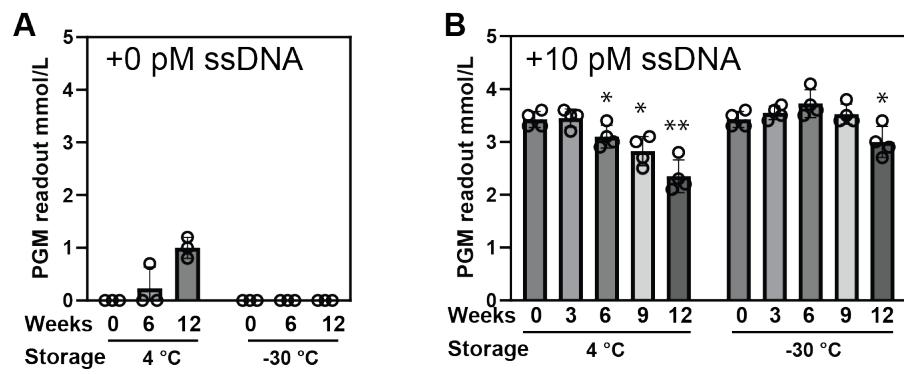

Figure S4. Stability of Cas12a ILR reporter over prolonged storage. Aliquots of ILR, stored at 4 °C or frozen at -30 °C for extended periods, were subjected to the Cas12a/ILR/PGM assay when directly stimulated with 0 pM (A) or 10 pM (B) ssDNA target.

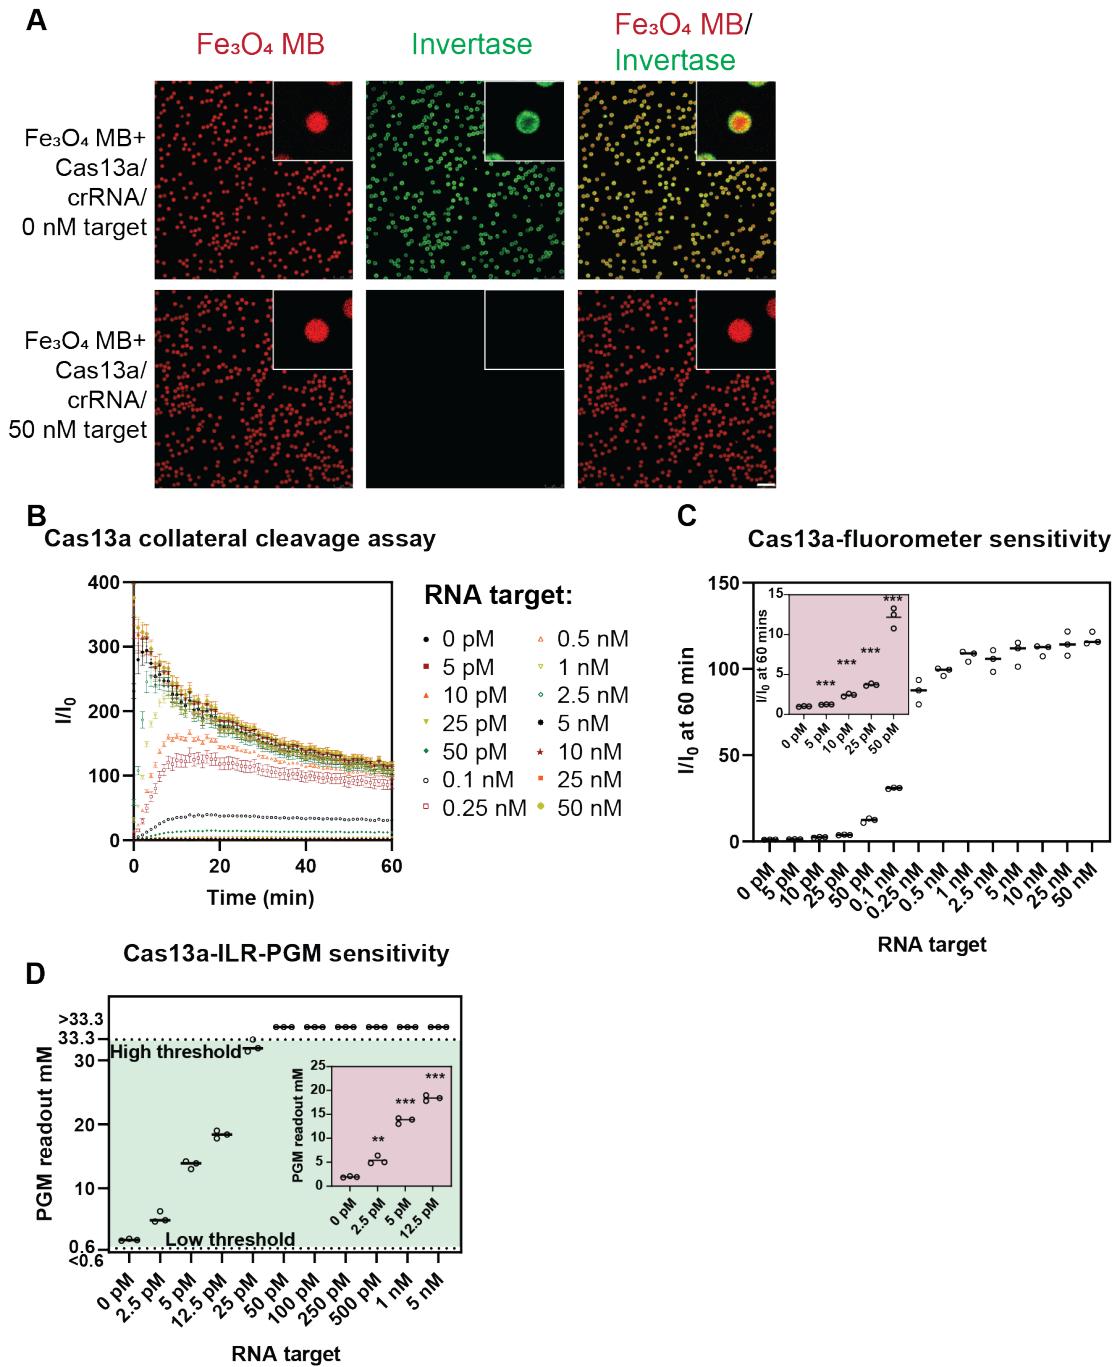

Figure S5. The Cas13a-ILR-PGM system demonstrates satisfactory sensitivity for RNA detection. (A) Confocal fluorescence microscopy to confirm target-dependent release of invertase from the solid phase. The scale bar denotes 25 μm . (B) A typical Cas13a collateral cleavage assay, recorded using a BioTek Synergy Neo2 fluorometer. (C) LOD determination indicates an empirical LOD of 5 pM. (D) PGM readouts in response to serial dilution of RNA target using the Cas13a/ILR/PGM system, showing an improved LOD of 2.5 pM.

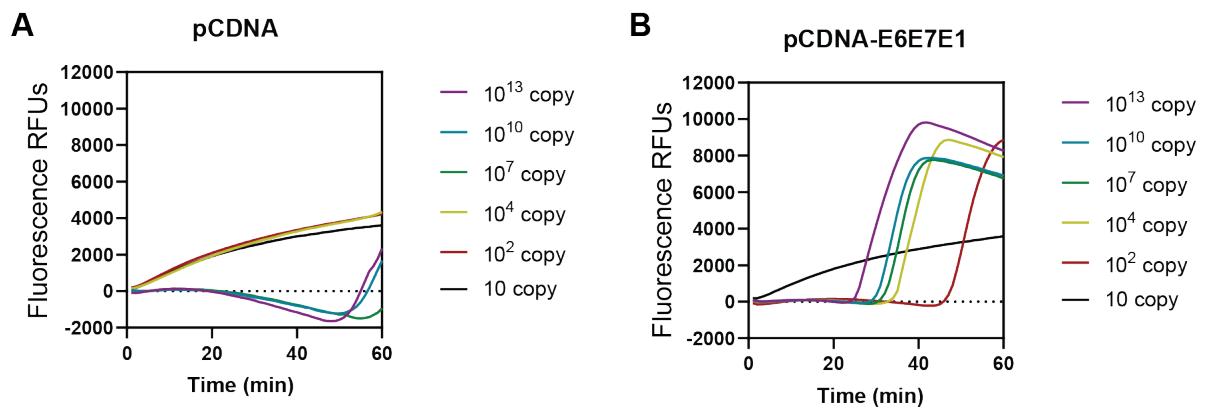

Figure S6. Real-time fluorescence of LAMP reactions with pCDNA3.1 (A) and pCDNA-E6E7E1 (B) plasmid templates.

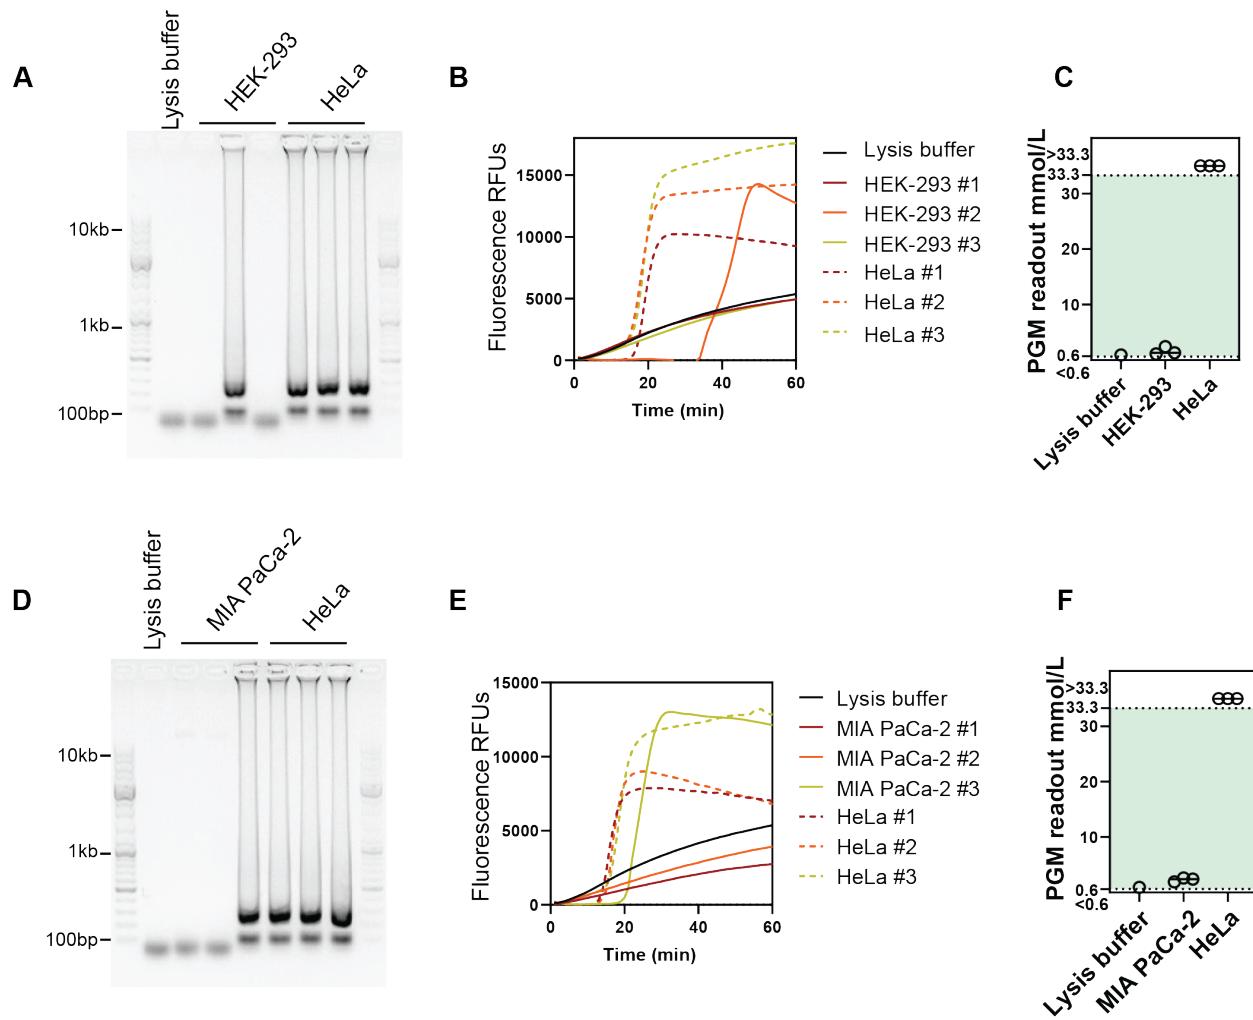

Figure S7. HeLa cells tested positive using the LAMP-Cas12a/ILR/PGM system. (A and D)
 Agarose gel showing the products of LAMP reactions with HEK-293, HeLa, and MIA PaCa-2 cell lysates. (B and E) Real-time fluorescence measurement of the LAMP reactions. (C and F) Subsequent Cas12a/ILR/PGM readouts of the LAMP products from (A-B) and (D-E), respectively.

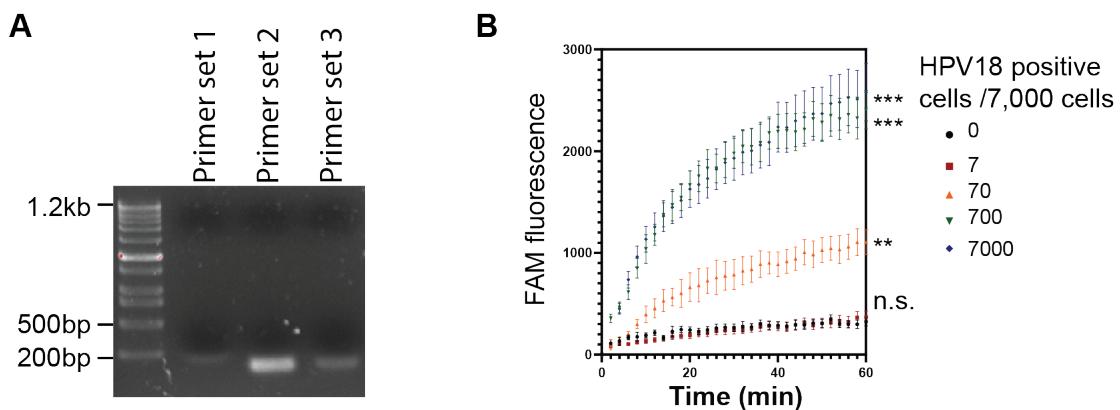

Figure S8. RPA-Cas12a/fluorometer-based detection of HPV18 gene in cultured cell samples. (A) Different primer sets were tested for optimal RPA amplification of the HPV18 gene. (B) Real-time monitoring of emerging FAM fluorescence in the tandem RPA-Cas12a/fluorometer assay (DTECTCR).

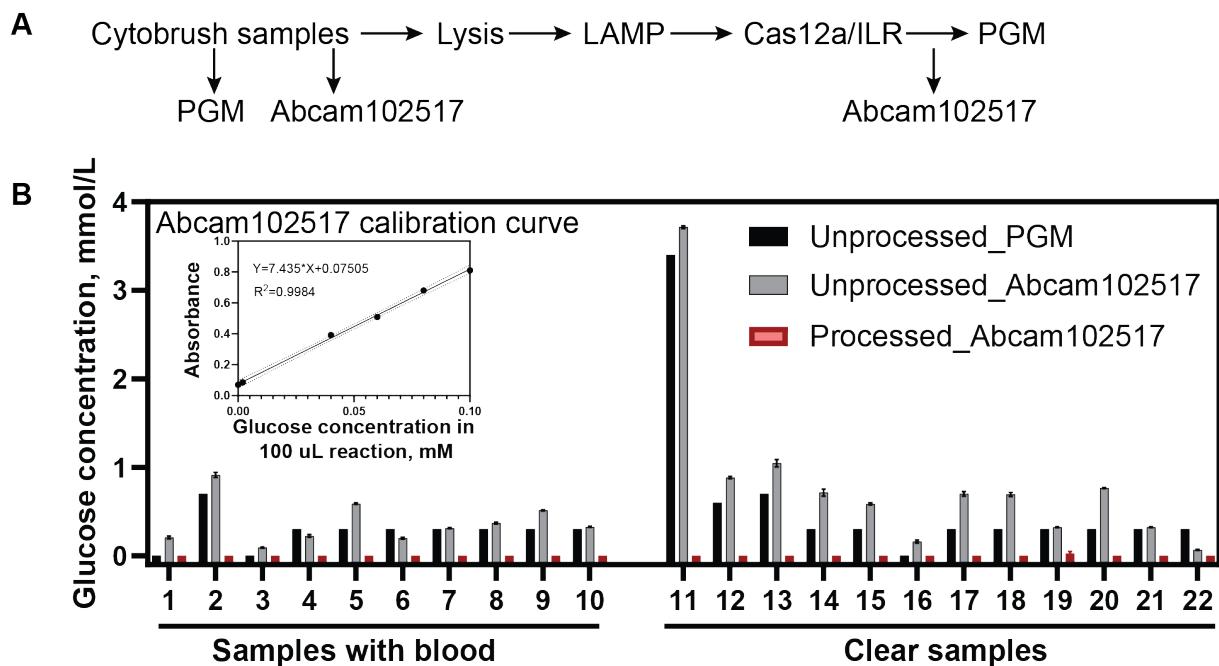

Figure S9. Intrinsic glucose in cytobrush samples shows negligible interference with the LAMP-Cas12a/ILR/PGM system. (A) Unprocessed cytobrush samples and intermediate reaction mixtures were subjected to glucose measurement. In addition to PGM, an Abcam glucose assay kit was used to quantify glucose at concentrations ranging from 0.02 to 10 mM. (B) Glucose concentrations in all 22 samples, with or without visible blood, decreased to negligible levels after processing. Note: all PGM reads of “E-2” and “Lo” were assigned values of 0 and 0.3 mmol/L, respectively. For the Abcam assay, all absorbance values below the Y-intercept of the calibration curve were assigned a glucose concentration of 0 mmol/L.

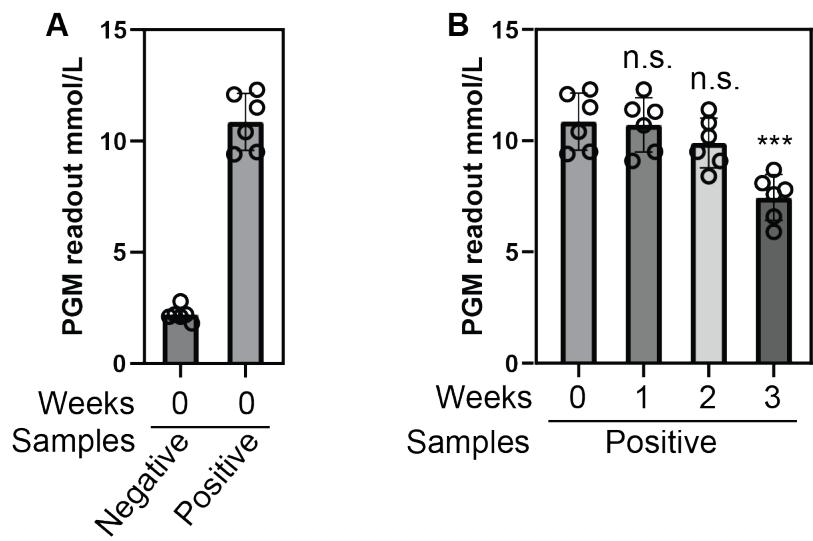

Figure S10. Stability and reproducibility of the HPV18 LAMP-Cas12a/ILR/PGM system in its ready-to-use format. (A) Individual tubes of LAMP reaction mixture, Cas12a/ILR, and sucrose solutions at their complete compositions were prepared and stored at -30 °C for the indicated duration. The reagents were then used to test pellets from a pair of randomly selected negative and positive samples, evaluating system reproducibility and stability. The testing revealed a relative standard deviation (RSD) of 14.9% for the negative sample and 11.8% for the positive sample, indicating good reproducibility. (B) Significant signal degradation was observed in reagents stored for longer than 2 weeks.

Section B. Supplementary Tables

Table S1. CRISPR-Cas and PGM integration for nucleic acid detection

| Target | LOD | Verification in biological samples | Sensitivity and specificity | Reference PMID |
|---|--|--|--|----------------|
| HPV18, HPV16, and HPV52 | ~7 HPV18 positive cells per reaction | Cervical cellular samples (n=182, 88 and 88) | 95.8% and 100%; 100% and 100%; 100% and 100% | This work |
| CRISPR-Cas PGM integration for nucleic acid detection | 57 pM | Nucleic acid molecules | NA | 39171545 |
| HIV (DNA and RNA) | 43 copies and 200 copies per test, respectively. | Plasma samples (n=15) | 85.7% and 100% | 36762838 |
| HIV-related DNA or SARS-CoV-2 N gene | 11.0 fM and 50 copies/ μ L, respectively. | Nucleic acid molecules | NA | 35689948 |
| miRNA-21 and miRNA-205 | 2.4 and 1.1 pM, respectively. | Nucleic acid molecules | NA | 34279073 |
| Alpha-fetoprotein | 10 ng/mL | Clinical serum samples (n=11) | 100% and 100% | 37303825 |
| N-gene and PCB77 | 6 fM and 3.2×10^{-5} μ g/L, respectively. | Nucleic acid molecules | NA | 36220300 |
| SARS-CoV-2 N-gene | 1.8×10^4 virus particles (VPs) per μ L | Throat swab samples (n=6) | 100% and 100% | 34276930 |
| SARS-CoV-2 N gene | 10 copies/ μ L | Throat swab samples (n=11) | NA | 33410130 |
| | 0.15 pM | Nucleic acid molecules | NA | 38503121 |

Table S2. Nucleic acid sequence

| Name | Sequence | Figures |
|----------------------|--|--|
| P81L4 crRNA (HPV18) | UAAUUUCUACUAAGUGUAGAU ccagccccgacgagccgaacc (Cas12a) | 3E |

Table S7. Preceding HPV detection development

| Category | System | Target | Readout | Pre-amplification | POCT potential | LOD | Clinical samples | Sensitivity and specificity | Reference PMID or DOI |
|---------------------|---|----------------------------|---------------------------------------|-------------------|----------------|--------------------------------------|--|---|---------------------------|
| CRISPR-Cas-Mediated | Cas12a/ILR/PGM | HPV18; HPV16; HPV52 | PGM | LAMP | YES | ~7 HPV18 positive cells per reaction | 182, 88 and 88 cervical cellular samples | 95.8% and 100; 100% and 100%; 100% and 100% | This work |
| | Cas12a | 13 types of high-risk HPVs | Fluorescence | RPA | NA | 500 copies per reaction | 3 samples each type | 100% and 100% | 34140632 |
| | Cas12a | HPV-16; HPV-18 | Fluorescence | RPA | NA | 1 aM | 25 patient samples each type | 100% and 100%; 75% and 100% | 29449511 |
| | Cas12a | HPV-16 | Electrochemical | NA | YES | 50 pM | NA | NA | 31568601 |
| | Cas12a | HPV-16; HPV-18 | SERS | NA | NA | 1 aM | NA | NA | 34369760 |
| | Cas12a | HPV-16; HPV-18 | Fluorescence | NA | NA | 38.7 fM | 15 patients | 100% and 100%; 100% and 100% | 10.1016/j.snb.2023.134813 |
| | Cas12a | HPV-16; HPV-18 | Fluorescence | NA | YES | 5 fM | NA | NA | 10.1002/aic.17365 |
| Others | Cas12a | HPV-16 | Electrochemiluminescence (ECL) | NA | NA | 8.86 fM | NA | NA | 37402133 |
| | Electrochemical Immunosensor (GCE-OLC-PAN) | HPV-16 L1 (antigen) | Electrochemical | NA | NA | 0.61 fg/mL (10.89 n aM) | NA | NA | 37384904 |
| | Microfluidic portable all-in-one device (PAD) | HPV-16; HPV-18 | colorimetric | LAMP | Yes | 1 copy/μl | 206 clinical samples | 92.1% and 99.0% | 38150799 |
| | SlipChip-based Integrated Point-of-Care (SIPoC) system | HPV-16; HPV-18 | Fluorescence | qPCR | NA | 200 copies/mL | 130 participants | 96.2% and 100%; 90.0% and 100% | 39320328 |
| | Self-digitization (SD) microfluidic chip | HPV-18 | Fluorescence | digital LAMP | NA | NA | NA | NA | 30734822 |
| | distance microfluidic paper-based analytical devices (dμPAD) | E7 mRNA | Fluorescence | RCA | Yes | 10 fM | 40 samples | 87.5% and 93.5% | 38912660 |
| | LFA | 14 high-risk HPV type | colorimetric | RPA | Yes | 1~10 copies of HPV DNA per reaction | 198 samples | 96% and 83% | 37606488 |
| | Oligonucleotide capped nanoporous anodic alumina films sensor | 14 high-risk HPV type | Fluorescence | NA | NA | NA | 43 samples | 100% and 93-100% | 37285852 |
| | Artificial chaperone-enhanced MNAAzyme (ACEzyme) system | HPV-16 | Electrochemical | NA | NA | 0.88 pM | NA | NA | 35690559 |
| | ECL sensing system | HPV 16 | Electrochemiluminescence (ECL) sensor | NA | NA | 0.03 nmol L ⁻¹ | NA | NA | 32339153 |
