

Supplemental Figure S1

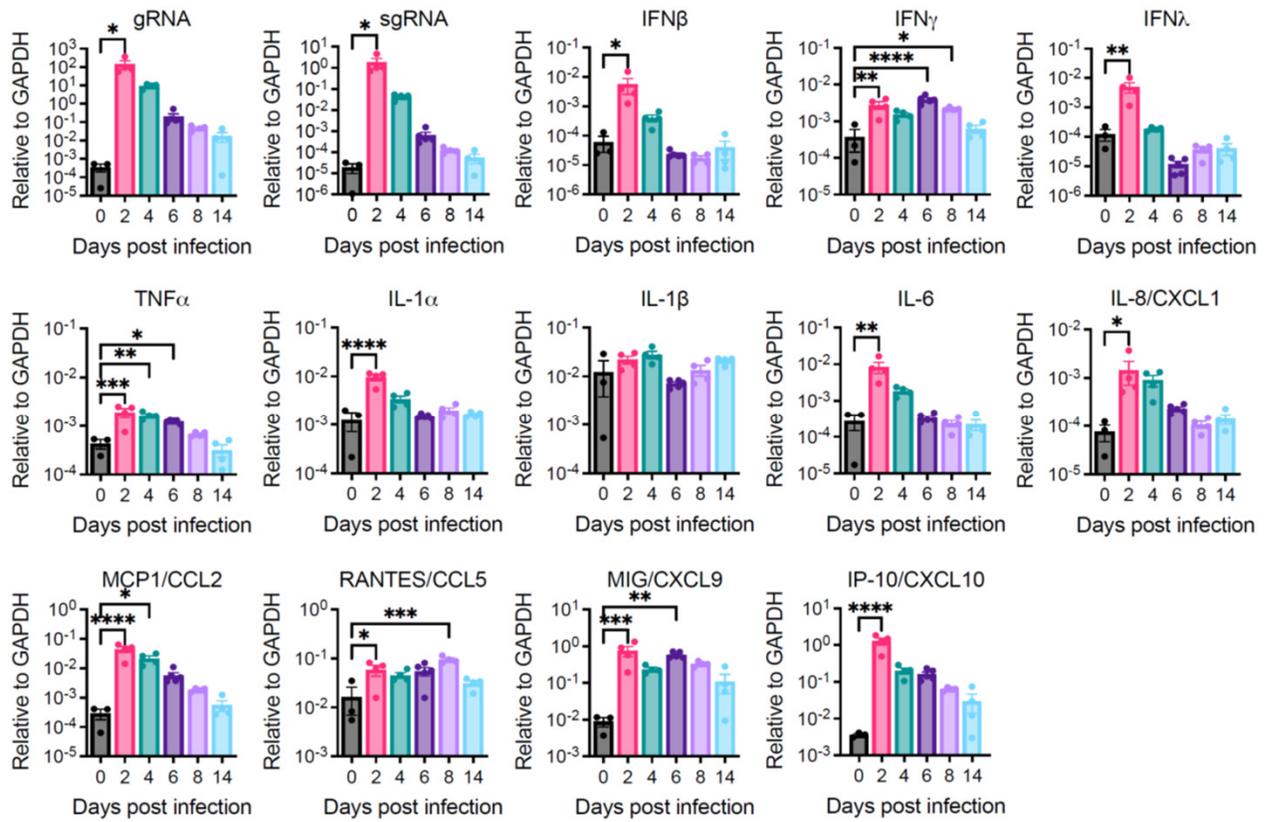

Figure S1. SARS2-N501Y_{MA30} virus RNA replication and host immune responses in the lungs. Total RNA was extracted from lungs collected from C57BL/6 mice (n=3 to 5), intranasally infected with 10⁴ PFU of SARS2-N501Y_{MA30} at designated dpi. Viral RNA, as well as host cytokine and chemokine transcripts, were quantified using qRT-PCR. Viral gRNA or sgRNA CT values from mock-infected tissues (0 dpi) exceeded 35. Transcript levels were normalized to GAPDH and presented as 2^{-ΔCT}. Statistical significance was assessed using ordinary one-way ANOVA, with significance levels indicated as follows: *p<0.05, **p<0.01, ***p<0.001, and ****p<0.0001. Data are presented as mean ± SEM.

Supplemental Figure S2

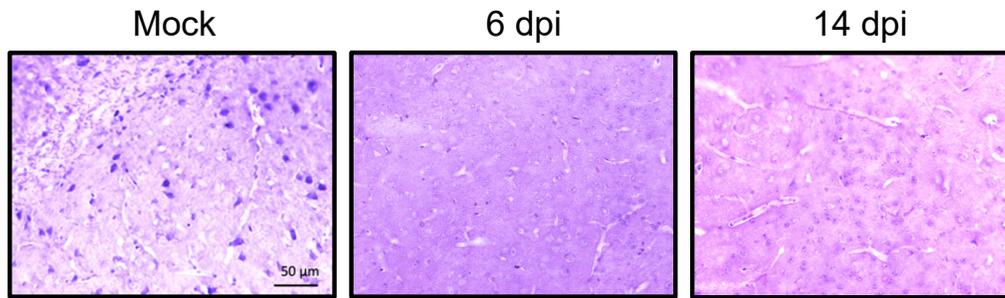

Figure S2. Brain histopathology after mock and SARS2-N501Y_{MA30} infection. The representative images of brain tissue sections were stained with H&E staining at indicated days following either mock or SARS-CoV-2 infection. Scale bar: 50 μm.

Supplemental Figure S3

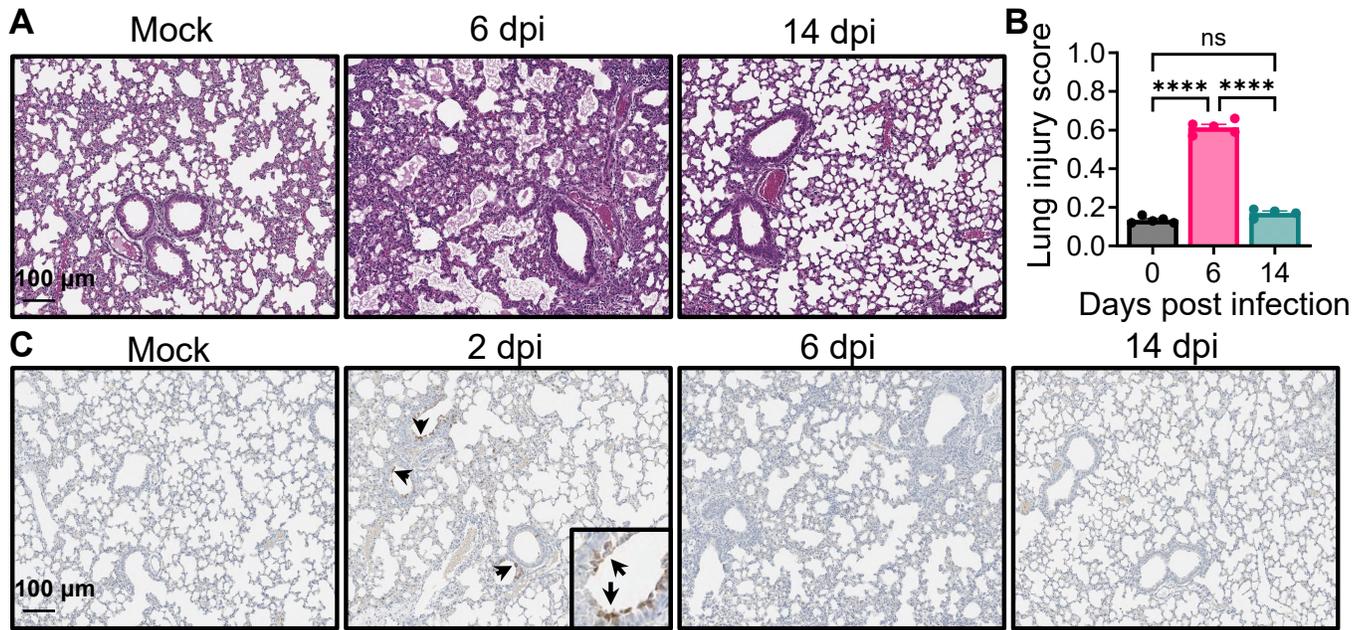

Figure S3. Lung pathology and immunohistochemistry of viral protein. (A) Lung sections from mice infected with SARS2-N501Y_{MA30} (n=5 for mock infection and 6 dpi; n=4 for 14 dpi) underwent H&E staining. (B) Acute lung injury severity was assessed blindly following ATS guidelines [32], with 0 for no injury, 1 for mild to moderate injury, and 2 for severe injury. ****p<0.0001. Data are shown as mean ± SEM. (C) Lung tissue immunohistochemistry revealing SARS-CoV-2 N protein (black arrows) at specified dpi.

Supplemental Figure S4

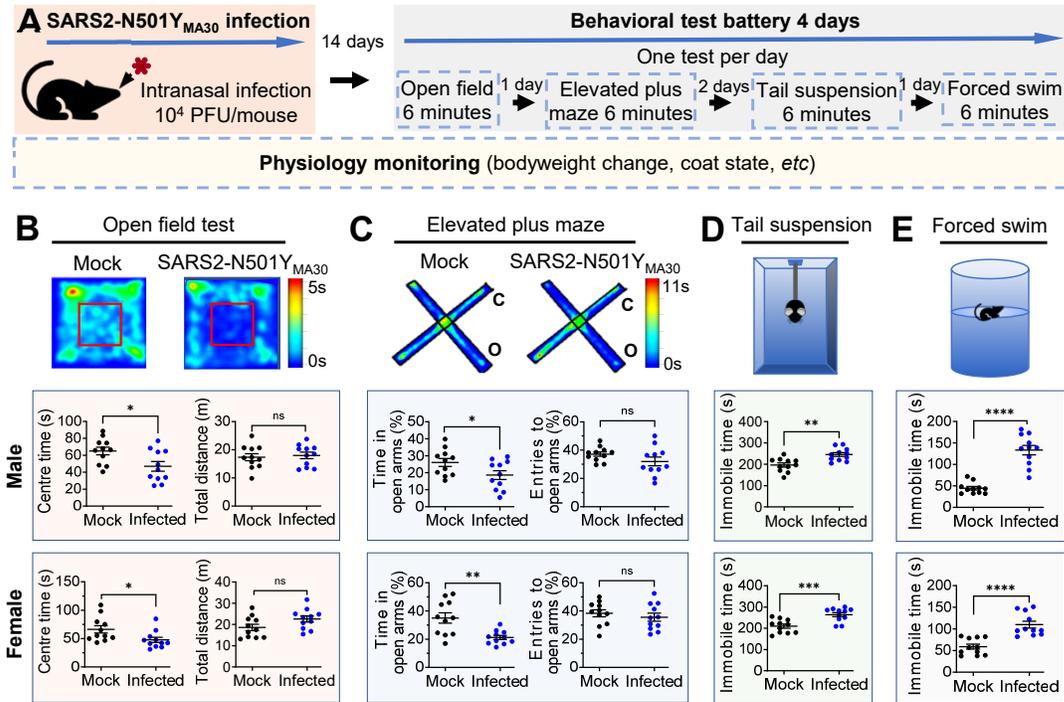

Figure S4. Gender dependent anxiety- and depression-like behaviors in mice following SARS2-N501Y_{MA30} infection. (A) Experimental design and timeline illustrating the administration of SARS2-N501Y_{MA30} and the behavioral test battery. (B) Open field test. Top: Representative heat map tracking of activity in the mock and SARS2-N501Y_{MA30} infected mice. Bottom: The total travel distance and time spent in the center area are shown for males and females, respectively. Statistical significance: Male group: * $p=0.0219$; ns, $p=0.7185$; $n=11$ mice in each group. Female group: ** $p=0.0331$; ns, $p=0.0722$; $n=11$ mice in each group. (C) Elevated plus maze test. Top: Representative heat map tracking of activity in mock and SARS2-N501Y_{MA30} infected mice in closed arms (C) and open arms (O). Bottom: The percentages of time spent in the open arms and the number of open arm entries are shown for males and females, respectively. Statistical significance: Male group: * $p=0.0457$; ns, $p=0.1487$; $n=11$ mice in each group. Female group: ** $p=0.0022$; ns, $p=0.4732$; $n=11$ mice in each group. (D) Schematics of the tail suspension test and results showing immobile time in males and females, respectively. Statistical significance: Male group: ** $p=0.0014$; $n=11$ mice in each group. Female group: *** $p=0.0007$; $n=11$ mice in each group. (E) Schematics of the forced swim test and results showing immobile time in males and females, respectively. Statistical significance: Male group: **** $p<0.0001$; $n=11$ mice in each group. Female group: **** $p<0.0001$; $n=11$ mice in each group. All statistical analyses were performed using a two-tailed unpaired Student's t-test. Data are presented as mean \pm SEM.

Supplemental Figure S5

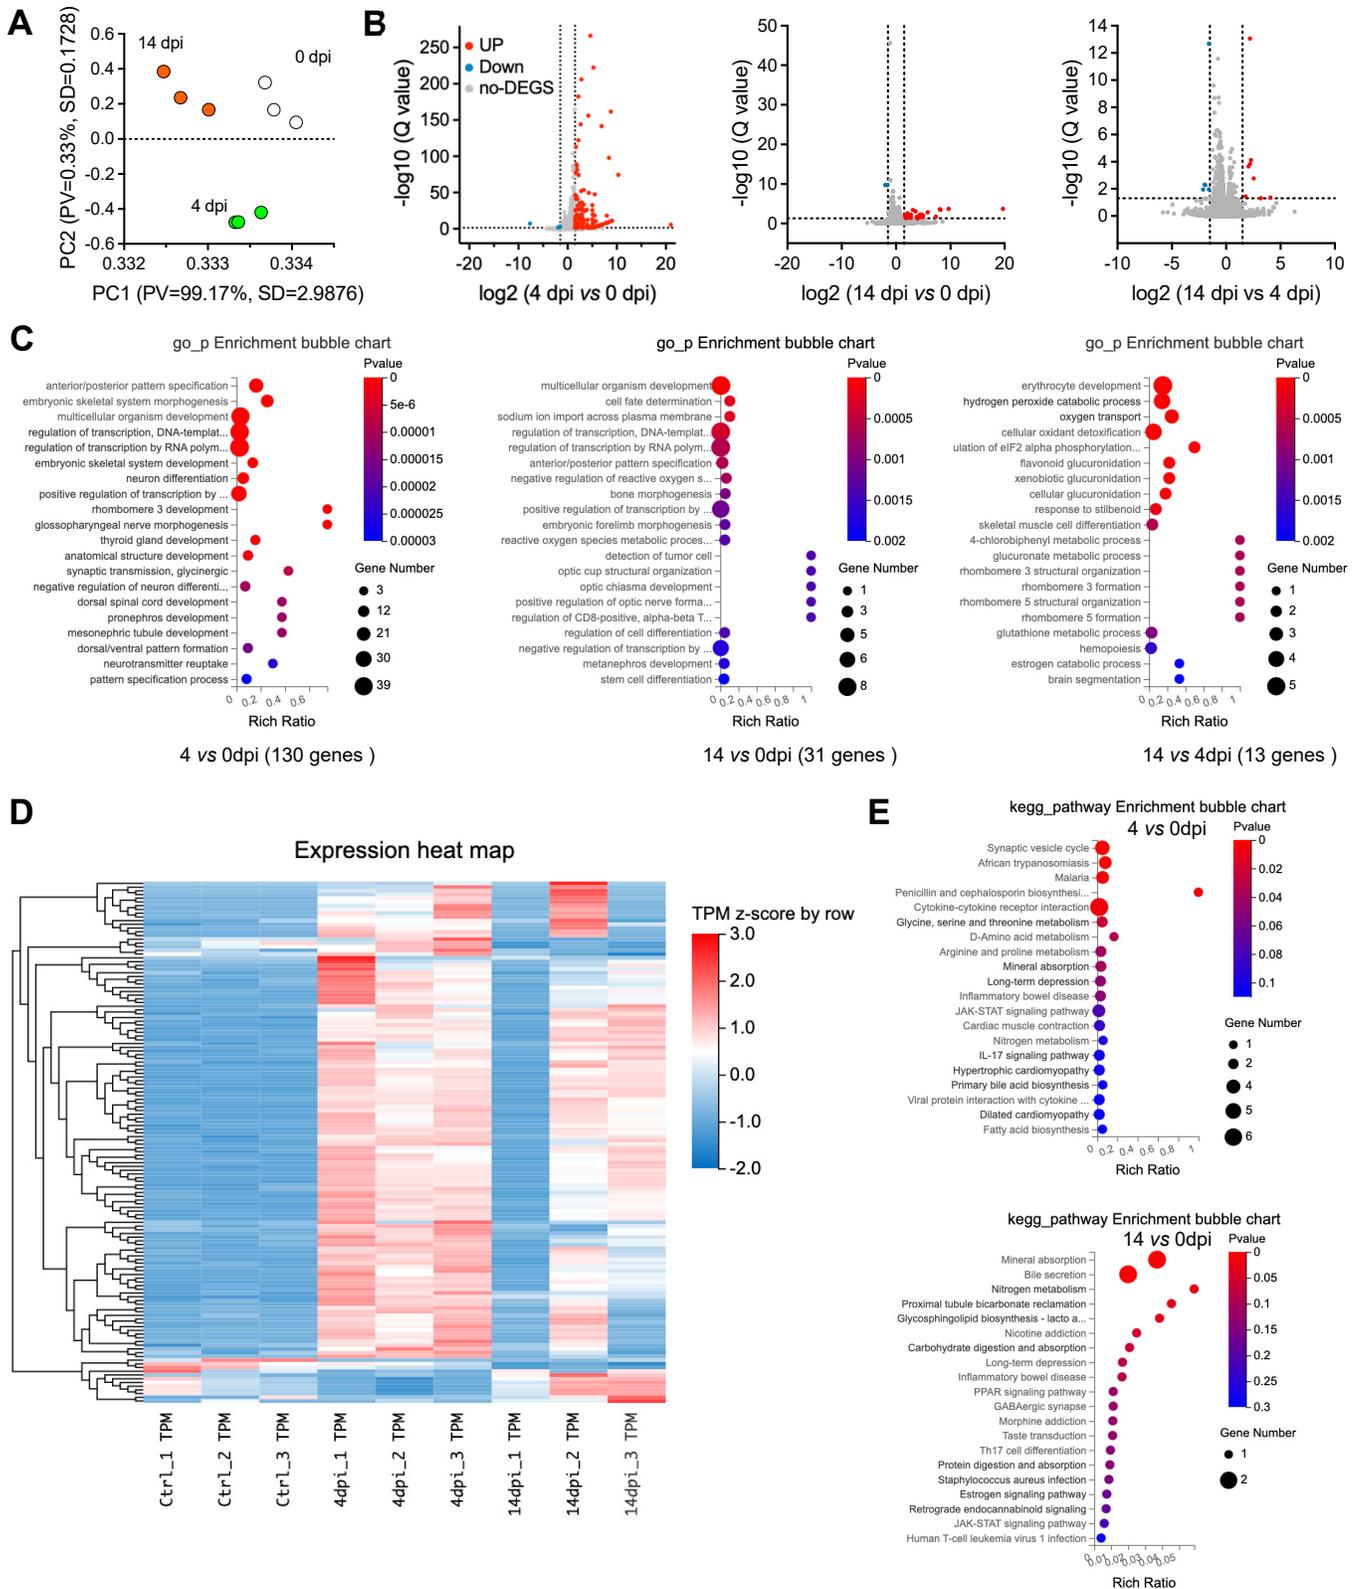

Figure S5. Transcriptomic profile overview in SARS2-N501Y_{MA30} infected mouse brains. (A) Principal component analysis (PCA) of transcriptome profiles comparing mock-infected brains (0 dpi) with those at 4 and 14 dpi. **(B)** Volcano plot analysis: The x-axis denotes \log_2 -transformed fold changes, and the y-axis indicates $-\log_{10}$ -transformed significant values (Thresholds set at $|\log_2\text{fold}| \geq 1.5$, $Q \text{ value} \leq 0.05$). **(C)** GO enrichment analysis of DEGs across groups. **(D)** Heatmap visualization of 140 DEGs identified post-infection. **(E)** KEGG pathway analysis comparing groups at 4 dpi vs 0 dpi, 14 dpi vs 0 dpi.

Supplemental Figure S6

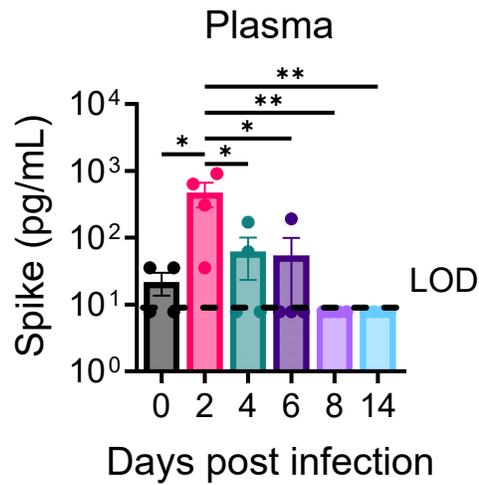

Figure S6. Detection of SARS-CoV-2 spike protein in plasma of infected mice by ELISA. C57BL/6 mice were intranasally infected with 10^4 PFU of SARS-CoV-2-N501Y_{MA30}. Plasma was collected at 0, 2, 4, 6, 8, and 14 dpi via submandibular blood collection. SARS-CoV-2 spike protein levels in plasma were determined using a SARS-CoV-2 spike RBD ELISA Kit. (n=4 per time point). Statistical significance: *p<0.05 and **p<0.01 were determined by ordinary one-way ANOVA. Data are presented as mean \pm SEM.

Supplemental Figure S7

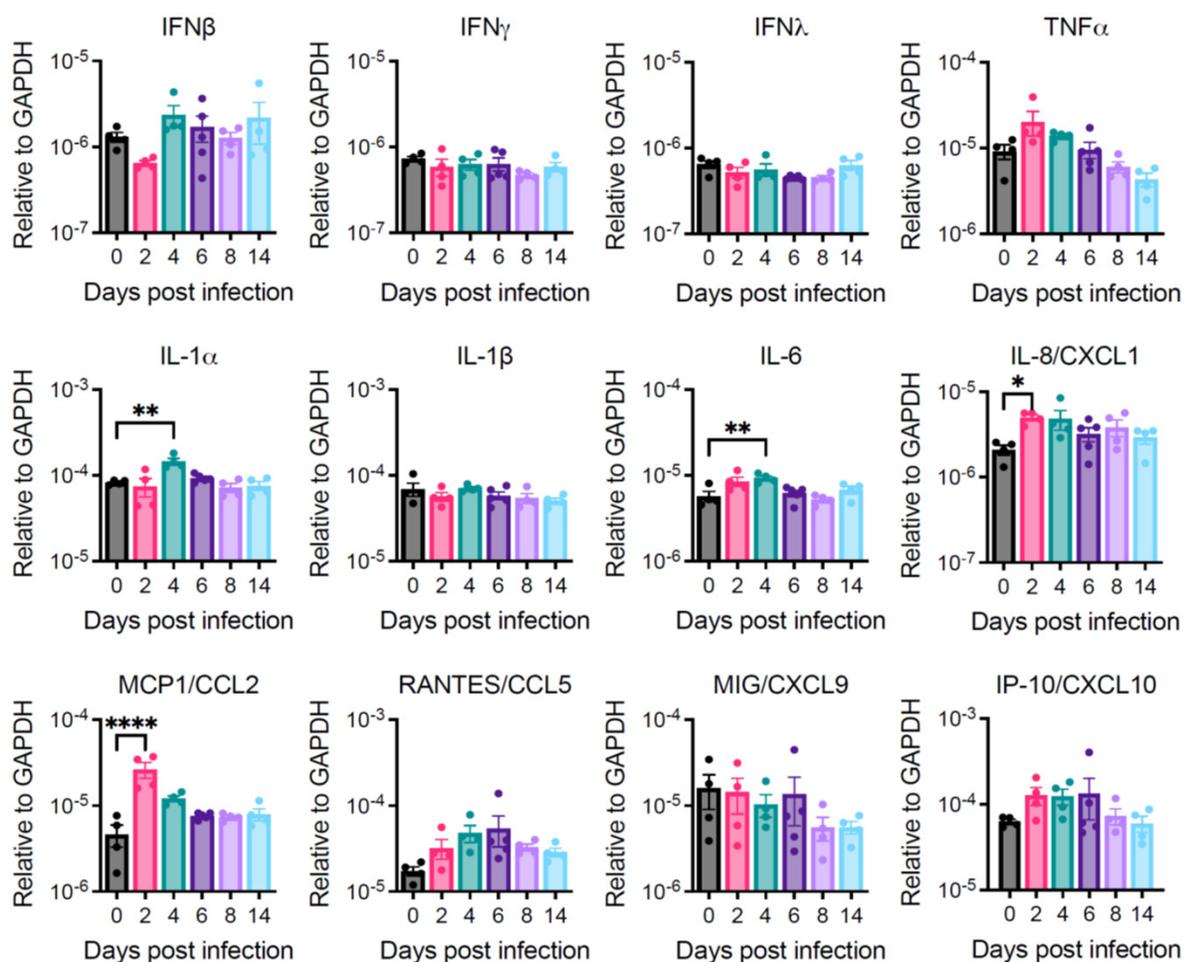

Figure S7. Cytokines and chemokines induced in the brain of SARS-CoV-2-infected mice. Brains of C57BL/6 mice intranasally infected with 10^4 PFU of SARS2-N501Y_{MA30} were harvested at indicated dpi. Cytokine and chemokine transcripts were measured by qRT-PCR analyzing total RNA extracted from mock-infected (0 dpi) and infected young C57BL/6 mice. Each brain was collected from one individual mouse. Mock (0 dpi), 2, 4, 8, 14 dpi: n=4; 6 dpi: n=5. The levels of transcripts were normalized to GAPDH and presented as $2^{-\Delta\Delta CT}$. Statistical significance: *p<0.05, **p<0.01, and ****p<0.0001 were determined by ordinary one-way ANOVA. Data are presented as mean \pm SEM.
